

Climate Change

Our cars are our biggest sources of greenhouse gases in Oakland. We can reduce emissions from them with transit-oriented housing and efficient public transportation. We should also install more bike lanes and boulevards.

Oakland can encourage the use of more electric vehicles by installing charging stations throughout the city. We should pay careful attention to locating the stations so that all Oaklanders have access to them. Studies show that a significant barrier to buying electric vehicles is a lack of access to charging stations.

We can also reduce emissions through the electrification of new buildings. This will create incentives to produce more renewable energy, which will bring the cost of renewable energy down, thereby reducing the cost of electrification.
